WEBSITE REDEVELOPMENT

Development Requirements & Implementation Report

MK Publicity | mkpublicity.com

A developer-ready blueprint to rebuild the website as a credible, mobile-first lead-generation asset with clear service positioning, strong user experience, search visibility and measurable conversions.

DOCUMENT FIELD	DETAIL
Prepared for	MK Publicity
Website	https://mkpublicity.com/
Report date	16 October 2026
Purpose	Scope, design, content, SEO/AEO, technical implementation and launch acceptance

Important: This report translates a public-facing content review into implementation requirements. It is not a claim that a full source-code, analytics, browser-rendering, accessibility or Core Web Vitals audit has been completed.

1. Executive direction

Objective: redevelop MK Publicity's website into a polished, trustworthy and conversion-focused digital presence that explains the agency's services, demonstrates real work, supports local and service-led search discovery, and turns relevant visitors into qualified enquiries.

Primary recommendation

Do not treat this as a visual redesign alone. Deliver the redesign together with service-page architecture, credible proof, technical SEO, analytics and a tested enquiry journey.

Business outcomes the website should support

- Make MK Publicity's main services and value proposition clear within the first screen on desktop and mobile.
- Build confidence through verified results, real portfolio work, clear business information and transparent service scope.
- Create focused landing pages for the services and locations the business can genuinely serve.
- Improve crawlability, indexability, page relevance and eligibility for search features through sound technical implementation.
- Measure calls, WhatsApp conversations, form submissions and qualified leads rather than reporting traffic alone.

Project success measures

AREA	MEASURE	HOW TO VALIDATE
Usability	Visitors can understand the offer and reach contact actions easily	Desktop, mobile and keyboard-based UAT
Conversion	Enquiry actions work and are tracked	Submit test form, click-to-call/WhatsApp tests, analytics debug view
SEO	Priority pages are indexable, unique and internally linked	Search Console, URL Inspection, crawl and metadata checks
Performance	Good field performance as traffic data becomes available	PageSpeed Insights, Lighthouse and Search Console CWV
Trust	All client, testimonial and performance claims are supportable	Client approval and evidence register

How to use this report

Treat the requirements below as the development scope and QA baseline. The developer should first inventory the current CMS, hosting, analytics, forms, URLs and integrations; then document what can be retained, what needs refactoring and what needs a full rebuild.

2. Audit findings and confidence levels

The prior review of publicly surfaced and indexed homepage content identified potential credibility and positioning issues. Because some counters could be dynamically rendered or stale in the indexed version, confirm them against the live page and source before making changes.

PRIORITY	FINDING / RISK	REQUIRED ACTION
P0	Indexed content presented conflicting counts, including 500+ claims alongside 0+ counters and a 0% satisfaction figure.	Verify every number. Remove placeholder values and unsupported claims. Ensure visible, server-rendered content is consistent.
P0	Performance statements, testimonials and outcome claims need evidence.	Create a claim register. Obtain client permission and substantiate results with date range, baseline and measurement method.
P1	Homepage title and hero positioning were broad and did not clearly prioritize the main local commercial intent.	Rewrite title, H1, supporting copy and CTA around validated service priorities and target geography.
P1	Multiple service areas require clear page-level intent and dedicated content.	Build a service overview plus focused pages for priority revenue-generating services.
P1	CTA language and enquiry routes need conversion-focused review.	Use one primary CTA, a secondary proof CTA and clear call/WhatsApp/form paths.
VERIFY	Page speed, accessibility, canonical tags, schema, crawl controls, analytics and mobile layout are not confirmed.	Run a technical baseline before deciding whether fixes, refactoring or migration are required.

Do not assume

No specific performance failure, missing schema, broken form or accessibility defect should be reported as confirmed until it is tested. This report defines how those items must be verified.

3. Proposed information architecture

Keep navigation simple and aligned to how prospects evaluate an agency. Use the current URL inventory to preserve any established organic equity; apply redirects if URLs change.

PAGE / TEMPLATE	PURPOSE	PRIORITY
Home	Positioning, proof, priority services and main conversion paths	P0
Services overview	Explain the service portfolio and help users choose a path	P0
Meta Ads / paid advertising	Capture high-intent paid campaign enquiries	P0
Social media marketing	Explain management scope, content, reporting and fit	P0
SEO services	Explain SEO deliverables, process, reporting and expectations	P1
Influencer marketing	Show creator campaigns, selection, coordination and measurement	P1
PR and publicity	Explain media relations, publicity scope and deliverables	P1
Video and reels production	Show production capabilities and finished work	P1
Website / e-commerce development	Publish only if actively offered and supported by delivery capability	P2
Case studies / portfolio	Prove relevant delivery and business impact	P0
Industries	Show sector expertise where MK Publicity has relevant experience	P2
About / team	Build trust through genuine people, experience and business context	P1
Insights / resources	Answer buyer questions and build topical depth over time	P2
Contact	Make contact methods, service area and enquiry form obvious	P0
Privacy policy / terms / cookie notice as applicable	Explain data use and applicable site policies	P0

Navigation suggestion: Home · Services · Industries · Work / Case Studies · Insights · About · Contact. Avoid adding a page solely to target a keyword if it repeats another page without a distinct customer need.

4. Page-level content and UX requirements

4.1 Homepage sequence

ORDER	SECTION	REQUIREMENTS
1	Hero	One clear H1; who the agency helps; concise value proposition; primary CTA “Get a Free Marketing Audit” only if this offer is genuinely available; secondary CTA “View Our Work”.
2	Trust strip	Use approved client logos, verified partner credentials, genuine ratings or factual trust signals. Do not use invented or generic logos.
3	Priority services	Show 4–6 core services, each with outcome-led copy and a link to its dedicated landing page.
4	Selected work	Show real campaigns or projects; allow visitors to inspect the service, objective and outcome.
5	Results / proof	Use metrics only when evidence, context, measurement period and client consent exist.
6	Why MK Publicity	Specific differentiators: working model, reporting, service scope and communication. Avoid unsupported superlatives.
7	Process	Discovery → plan → production/setup → launch → optimization → reporting, adjusted to actual operations.
8	Testimonials	Approved and attributable testimonials. Clearly label anonymized feedback if client permission restricts identity.
9	FAQs	Answer real pre-sales questions. Keep answers useful, visible and service-specific.
10	Final conversion section	Repeat the main CTA, list genuine contact options and show consistent business information.

4.2 Service page template

- Hero: service name, intended customer, main outcome and single primary CTA.
- Problem and fit: situations the service is designed to address; include exclusions or limitations where helpful.

- What is included: scope, deliverables, platforms, production responsibilities and reporting cadence.
- Process: required client inputs, approval steps, launch process and optimization approach.
- Proof: relevant case studies, examples or approved testimonial evidence.
- Pricing approach: publish pricing or explain what determines the quote; do not imply a fixed package if scope varies.
- FAQs: answer cost, timelines, deliverables, ownership, reporting and expectations truthfully.
- Conversion: enquiry form, call and/or WhatsApp route with explicit next-step expectations.

4.3 Case study template

Every case study should capture: client/sector (with permission), challenge, starting context, objectives, services delivered, campaign period, what was actually done, results and their measurement source, creative examples, lessons and next steps. Label estimates and third-party platform metrics correctly. Never manufacture client names, logos, reviews or result figures.

4.4 Contact and lead forms

- Ask only for information needed to respond: name, business, contact method and service of interest; additional fields must have a clear business reason.
- Validate required fields and formats on both client and server. Show inline errors, loading state, success confirmation and a useful recovery state.
- Send leads to the agreed inbox/CRM and store them only in approved systems with access controls and retention rules.
- Protect against spam using a proportionate method; test it with keyboard and assistive-technology users.
- Add privacy wording and consent where required. Do not send names, phone numbers, email addresses or message text into analytics event parameters.
- Use correctly formatted tel: and mailto: links. WhatsApp links must be tested on mobile and desktop and should not promise instant replies unless staffed.

5. UI/UX and visual design system

The visual direction should feel premium, contemporary, business-focused and intentional—not like a generic agency template. Final colors and typography must be derived from the approved MK Publicity logo and brand assets; report colors are only for this document.

AREA	IMPLEMENTATION REQUIREMENTS
Brand and layout	Create a defined grid, spacing scale, type scale, button system, card system and consistent content width. Use ample white space and controlled accent color.
Typography	Use one high-quality display style and one readable body family at most. Avoid oversized all-caps paragraphs, dense text and unnecessary decorative fonts.
Imagery	Prefer original photos, actual campaign creatives and finished video work. Optimize image dimensions and file size; avoid stock imagery that misrepresents the team or clients.
Responsive design	Design from narrow mobile through tablet and desktop. Check navigation, forms, tables, cards, headings and media at 320px, 375px, 768px, 1024px and wide desktop.

AREA	IMPLEMENTATION REQUIREMENTS
Motion	Use purposeful, short transitions only. Respect reduced-motion preference. No intro animation or scroll effect should delay content or block the CTA.
Accessibility	Target WCAG 2.2 AA practices: semantic landmarks, correct heading order, keyboard access, visible focus, form labels/errors, sufficient contrast and meaningful alt text.
Interaction states	Design hover, focus, active, disabled, loading, success and error states. Do not use buttons for non-actions or non-semantic clickable containers.
Trust cues	Make contact details, business identity, privacy information and proof easy to find. Avoid fake scarcity, fake chat indicators and unsubstantiated awards.

Minimum responsive QA

- No horizontal overflow, clipped headings or overlapping floating controls.
- The primary CTA is visible early and remains usable on touch devices.
- Navigation works with mouse, keyboard and touch; the mobile menu closes correctly.
- Forms are usable with autofill, keyboard navigation and mobile keyboards.
- Text remains readable when zoomed to 200%; layouts do not rely on color alone.

6. SEO implementation specification

6.1 Keyword-to-page map

TARGET PAGE	PRIMARY TARGET	CONTENT ANGLE
Homepage	digital marketing agency in Surat	Main agency proposition, location, core services and proof
Social media marketing	social media marketing agency in Surat	Management scope, content workflow, channels and reporting
Meta Ads	Meta Ads agency in Surat	Campaign setup, audience strategy, creative testing and reporting
SEO services	SEO company in Surat	Technical, on-page, content and reporting scope
Influencer marketing	influencer marketing agency in Surat	Creator fit, campaign scope, approvals and measurement
PR and publicity	PR agency in Surat	Actual media/publicity services and proof of delivery
Video / reels	video production company in Surat	Pre-production, filming, editing, formats and portfolio
Website development	website development company in Surat	Platforms, scope, integrations and case studies; publish if offered

TARGET PAGE	PRIMARY TARGET	CONTENT ANGLE
Industry page	industry + marketing service phrase	A distinct sector problem and relevant experience, only when substantiated

These are proposed keyword targets, not measured search-volume or ranking estimates. Validate demand and competition with keyword research and actual Search Console query data before locking the roadmap.

6.2 On-page SEO requirements

- Unique, descriptive title tag and meta description for every indexable page; align them with the actual page content and search intent.
- One clear primary H1 per page and logical H2/H3 sections. Do not force keywords into headings unnaturally.
- Readable, stable URLs; lowercase slugs and hyphens; avoid changing existing URLs without a redirect and migration plan.
- Self-referencing canonical for the preferred version where appropriate; resolve duplicate URL variants and redirect chains.
- Crawlable HTML links and navigation; descriptive anchor text; contextual internal links between relevant services, work and resources.
- Descriptive image alt text when the image conveys meaning; empty alt for decorative images; compress and size images appropriately.
- XML sitemap containing canonical, indexable URLs; valid robots.txt; submit sitemap and inspect important pages in Search Console.
- Correct Open Graph/social metadata and a favicon; consistent branding and share previews.
- For any redesign or migration, crawl existing URLs, retain valuable content, map old-to-new URLs, implement permanent redirects and monitor 404s.

6.3 Local SEO requirements

- Confirm the exact public business name, address/service area, phone, email and hours. Keep them consistent on the site and legitimate business profiles.
- Link the Google Business Profile where appropriate and ensure its category and services reflect the actual business.
- Publish genuine local evidence: office/team/production photographs, local projects, approved reviews and accurate service-area information.
- Avoid making near-duplicate city pages that exist only to swap location names. Each location page must offer unique and useful information.

6.4 Structured data

Implement only applicable JSON-LD that truthfully reflects visible page information. Consider Organization or eligible LocalBusiness markup, BreadcrumbList, and Article/BlogPosting for editorial content. Service markup can describe the page but should not be represented as a guaranteed rich-result enhancement. Validate markup and resolve errors before launch.

7. AEO and AI-search readiness

AEO should be implemented through clear information architecture, direct answers and evidence-backed content—not through keyword stuffing or unsupported claims about special AI markup.

REQUIREMENT	IMPLEMENTATION
Direct answers	On each priority page, define the service and intended customer near the top, then explain details and limitations.
Buyer FAQs	Answer real questions on cost, scope, timeframes, reporting, required inputs and suitability. Keep answers visible and accurate.
Entity clarity	Use a consistent business name, description, contact information and team/about details across the site.
Experience and evidence	Publish original examples, author attribution where useful, measurable case studies and supporting sources.
Crawl access	Ensure important text is accessible to crawlers and not hidden exclusively inside images, inaccessible widgets or blocked client-side states.
Measurement	Monitor organic search performance and periodically sample relevant AI answers. Record actual citations/mentions separately from assumptions.

Suggested content backlog

- How much does digital marketing cost in Surat?
- How can a local business generate more leads online?
- Meta Ads vs Google Ads: which fits a local business?
- What should a social media management package include?
- How long does SEO take to produce measurable results?
- How can a textile business generate B2B enquiries online?
- What is included in a video/reels production package?

Create these only where the team can provide a useful, experience-backed answer. Avoid publishing shallow articles solely to increase URL count.

8. Technical requirements and performance

8.1 First perform a technical baseline

Before choosing a rebuild/migration path, record the existing CMS/framework, hosting, DNS/CDN, URL list, plugins/dependencies, form delivery, analytics tags, Search Console property, backlink-bearing URLs and any CRM or email integrations. Save a backup and a copy of current SEO metadata before deployment.

8.2 Implementation requirements

CATEGORY	REQUIREMENT / TEST
Reliability	HTTPS everywhere; no mixed content; valid redirects; useful 404 page; error logging; backups and documented rollback.
Security	Validate and sanitize form inputs server-side; keep secrets server-side; protect admin access; keep dependencies maintained; use least privilege.

CATEGORY	REQUIREMENT / TEST
Performance	Compress and size images, lazy-load below-the-fold media, limit heavy animation and third-party scripts, avoid layout shifts, cache static assets sensibly.
Core Web Vitals	Aim for LCP ≤ 2.5 s, INP ≤ 200 ms and CLS ≤ 0.1 at the 75th percentile. Treat these as performance targets, not current measured results.
Accessibility	Run automated checks and manual keyboard/screen-reader spot checks; test contrast, focus, labels, errors, modal behavior and reduced motion.
SEO controls	Test robots.txt, sitemap, canonical, noindex directives, redirects, status codes, rendered headings, structured data and social metadata.
Content delivery	Keep meaningful text crawlable and accessible; use responsive images and modern formats where supported.
Deployment	Separate staging and production; staging must not be indexed; use environment-specific config; smoke-test all priority URLs after release.

8.3 Analytics and conversion tracking

EVENT	WHEN TO FIRE	NOTES
form_submit_success	Only after server confirms successful lead submission	Do not count failed validation as a lead.
phone_click	User activates a telephone link	Record page/source, not private content.
whatsapp_click	User activates the WhatsApp CTA	Do not claim a conversation started until that is actually known.
email_click	User activates the email CTA	Use as a secondary engagement signal.
primary_cta_click	User activates the primary CTA	Use consistent naming across pages.
case_study_view	Optional meaningful case-study engagement	Do not over-instrument every scroll or hover.

Use GA4 and Google Search Console if they align with the business setup; confirm property ownership, consent requirements and event reporting. Test events with debug tools and exclude staff/test traffic where feasible. Do not send PII to analytics.

9. Delivery phases and handoff

PHASE	WORK	EXIT CRITERIA
1. Discovery	Inventory site, URLs, CMS, content, analytics, hosting and integrations; agree business priorities.	Approved scope, sitemap, risk list and redirect inventory.

PHASE	WORK	EXIT CRITERIA
2. UX and content	Wireframes, page templates, content brief, keyword map and claim/evidence register.	Stakeholder-approved page flow and content requirements.
3. Visual design	Desktop/mobile components, design system, states and high-fidelity page designs.	Design approval before full implementation.
4. Development	Build templates, pages, forms, integrations, responsive behavior, technical SEO and schema.	Staging site with all in-scope pages and functional flows.
5. Content migration	Publish approved copy, images, metadata, internal links and redirects.	Content sign-off; no unintended loss of priority URLs.
6. QA and UAT	Cross-browser/device, accessibility, form, analytics, SEO, security and regression testing.	All P0/P1 defects resolved or explicitly accepted.
7. Launch	Backup, release, redirect validation, live smoke test and Search Console sitemap submission.	Production sign-off and rollback plan documented.
8. Stabilization	Monitor errors, indexation, leads, analytics and performance; address launch regressions.	Handover pack and prioritized follow-up backlog.

Indicative planning ranges

For planning only, a focused redesign with roughly 8–12 page templates/pages may take approximately 3–5 weeks when content approvals, access and integrations are ready. A larger custom build, multiple unique pages, migration issues or delayed approvals can change this materially. Confirm the delivery schedule after Phase 1 discovery; do not promise a fixed date before dependencies are known.

Developer handoff deliverables

- Production website and source repository/access handoff as agreed.
- Approved design files or component library, responsive page templates and reusable sections.
- Page/content inventory, SEO metadata sheet, keyword-to-page map and redirect mapping.
- Forms and integrations configured with ownership and error-handling documentation.
- Analytics and conversion event list with evidence of test events.
- Technical QA report: crawl/status-code checks, structured-data validation, accessibility checks and performance results.
- Launch checklist, backups/rollback notes, environment variable inventory (without exposing secrets) and maintenance guidance.

10. Acceptance criteria and launch gate

The project is ready for launch only when the following requirements are satisfied or an authorized owner explicitly accepts a documented exception.

ID	ACCEPTANCE TEST	PASS CONDITION
AC-01	Content integrity	No placeholder counters, broken copy, invented reviews, unsupported awards or contradictory business claims.
AC-02	Navigation	All primary navigation, internal links and footer links reach the intended destination.
AC-03	Lead form	Required fields validate; successful submission reaches the agreed destination; failure and success states are usable.
AC-04	Contact actions	Phone, email and WhatsApp links work on supported devices and use approved details.
AC-05	Responsive layout	No unintended horizontal overflow or overlapping content at the agreed viewport matrix.
AC-06	SEO metadata	All priority indexable pages have unique titles, useful descriptions, one clear H1 and correct canonical/index controls.
AC-07	Migration	Old priority URLs map to the correct destination; redirects work; there are no avoidable redirect chains.
AC-08	Indexing readiness	Sitemap/robots are valid; staging is blocked from indexing; production priority pages are crawlable.
AC-09	Structured data	Applicable markup validates and matches visible page content; no critical validation errors remain.
AC-10	Analytics	Test conversions appear once and only after the defined successful action; no PII is passed as event data.
AC-11	Accessibility	Core journeys work by keyboard; labels, focus, contrast and error messages pass agreed checks.
AC-12	Performance	A report is captured for key templates; defined target failures are documented with remediation or approved exception.
AC-13	Security and recovery	HTTPS works, secrets are protected, backups exist and rollback procedure is documented.
AC-14	Ownership	Admin credentials, domain/hosting access, analytics ownership and maintenance responsibility are confirmed.

Severity definitions

LEVEL	DEFINITION	RELEASE RULE
P0 / Critical	Site unavailable, serious security issue, lead capture broken, major data loss, or severe false claims.	Must be resolved before launch.
P1 / High	Core navigation/CTA defect, broken priority page, indexability issue, severe mobile/layout issue.	Resolve before launch unless an owner accepts a written exception.
P2 / Normal	Polish, secondary content gaps, minor spacing or low-risk enhancements.	Can be scheduled after launch with ownership and target date.

11. Client inputs and project dependencies

Development cannot complete the highest-quality result without approved inputs. Collect these during discovery rather than inventing them during design.

- High-resolution logo, brand guidelines, approved colors/fonts and any existing creative assets.
- Confirmed list of services actually sold today, service boundaries, deliverables and target customer profiles.
- Verified phone, email, address/service area, office hours and preferred enquiry destination.
- Approved client logos, testimonials, case studies, campaign screenshots and evidence for every public metric.
- Access to current CMS/hosting/DNS, source repository where applicable, Search Console and analytics properties.
- Existing URL export and any known high-value pages, backlinks, campaigns or integrations that must be preserved.
- Privacy/legal review for enquiry collection, cookies/consent, testimonials, image permissions and retention.

Key risks to manage

RISK	MITIGATION
Unsubstantiated marketing claims	Require evidence/approval for metrics, client names, testimonials and outcome claims before publication.
SEO loss during redesign	Inventory existing URLs and metadata; map redirects; crawl before and after release; monitor Search Console.
Low-quality stock/generic visuals	Use brand-approved art direction and actual work. Review mobile and desktop designs before development.
Leads not reaching staff	Test server delivery, inbox/CRM routing, spam handling, notifications and monitoring end to end.
Scope creep	Approve page list, unique templates, integrations, content responsibilities and revision rounds before design begins.

12. Reference links and verification tools

The specification aligns with widely used official guidance. Developers should re-check current documentation at implementation time.

Final development instruction

Definition of done

Deliver a brand-consistent, responsive and accessible website with clear service-specific content, credible proof, technically sound SEO, answer-friendly information, working lead capture, tested analytics and a documented launch/handover. Do not mark the project complete based on visual appearance alone.

Document status: Development brief based on the public-facing review and proposed best practices. Technical conditions marked “verify” require direct testing. Priority and scope should be confirmed with the site owner during discovery.

First actions to start development

STEP	ACTION	OUTPUT
1	Confirm services, audience, location and commercial priorities.	Approved positioning brief
2	Collect brand assets, client permissions and proof for every public claim.	Content and evidence pack
3	Inventory current URLs, CMS, hosting, forms and analytics.	Baseline audit and migration plan
4	Approve sitemap, priority pages and conversion journey.	Signed-off information architecture
5	Approve desktop/mobile design before full build.	Design sign-off
6	Agree owners, launch criteria, access and maintenance responsibilities.	Delivery plan and acceptance owner
